

Abstract

A method for integrating a written communication means with a document generation means including the steps of: typing a predefined string of characters, by a user, into a document; recognizing said predefined string with a computer algorithm that opens a messaging window; entering a query from said user into said message window regarding unknown information intended to be located at the location of said predefined string; sending said query to a third party; receiving a response to said query; reading said response by said user for the purpose of said user accepting, or rejecting said response; transposing said predefined string with a portion of said response in the event said response was accepted, not transposing said predefined string with a portion of said response in the event said response is rejected. Another embodiment further includes the purpose of modifying said response including transposition of a modified response with a predefined character string.
